LAB 5: DECODERS/DEMULITPLEXERS

Components Required:

- IC 74138
- Bread board
- Light Emitting Diode (LED)
- Resistors($1\text{ K}\Omega$)

THEORY:

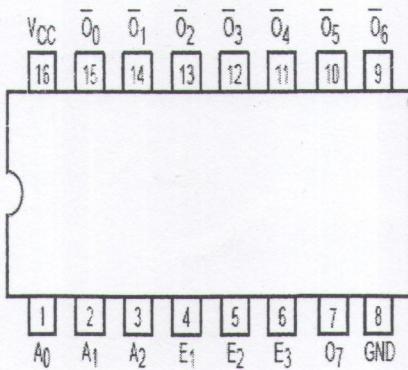

Decoder

- A decoder is a combinational circuit that converts binary information from n input lines to a maximum of 2^n unique output lines.
- A decoder generates 2^n minterms of n input variables

Demultiplexer

- A decoder with an enable input is a demultiplexer
- A demultiplexer is a circuit that receives information on a single line and transmits this information on one of the 2^n possible output lines.

L= LOW Voltage Level

X= Don't Care

Procedure:

1. Connect the IC as per the given diagram on the bread board.
2. Apply +5V as logic 1 input and ground as logic 0 input.
3. Check the outputs of logic gates using Light Emitting Diodes.
4. Obtain the outputs of the logic gates for different input conditions of the decoder.
